[0074]

CLAIMS

5 A transparent thin-film solar-cell module comprising a multilayer film comprising a first electrode layer, a semiconductor layer, and a second electrode layer stacked in that order on a main surface of a transparent insulating substrate; a cell region comprising a plurality of photoelectric conversion cells connected in series; and a 10 plurality of light-transmissive aperture holes in the cell region, the plurality of light-transmissive aperture holes being formed by removing at least the second electrode layer, the light-transmissive aperture holes each having a diameter of 30 μm to 500 μm , the plurality of light-transmissive 15 aperture holes being disposed in a line at a distance between the centers of the light-transmissive aperture holes of 1.01 to 2 times the diameter of each light-transmissive aperture hole.

20

25

[0075]

2. The transparent thin-film solar-cell module according to claim 1, wherein the plurality of light-transmissive aperture holes are disposed in a straight line at intervals of 1.01 to 1.5 times the diameter of each light-transmissive aperture hole.

[0076]

3. The transparent thin-film solar-cell module according to claim 1 or 2, wherein the light-transmissive aperture holes each have a diameter of 100 μm to 300 μm .

5 [0077]

4. The transparent thin-film solar-cell module according to any one of claims 1 to 3, wherein the area ratio of the total area of the light-transmissive aperture holes to the area of the cell region is 5% to 30%.

10

15

20

[0078]

5. The transparent thin-film solar-cell module according to any one of claims 1 to 4, wherein the light-transmissive aperture holes are disposed in a line parallel to the series-connection direction of the photoelectric conversion cells.

[0079]

6. The transparent thin-film solar-cell module according to any one of claims 1 to 5, wherein the light-transmissive aperture holes are disposed in lines parallel to each other at regular intervals.

[0800]

7. The transparent thin-film solar-cell module according to 25 any one of claims 1 to 6, wherein a back sealer is composed of a fluorocarbon resin or glass.

[0081]

8. A method for producing the transparent thin-film solar-cell module according to claim 1, the method comprising forming the light-transmissive aperture holes by irradiating the multilayer film with laser light, wherein the distance between the centers of adjacent light-transmissive aperture holes disposed in a straight line is determined by the frequency of Q-switching of the laser light and a relative scanning velocity between the transparent insulating substrate and the laser light.

10
